TECHNOLOGIES

Nanofiltration 4000 gpd

Technical specifications : Commercial and industrial nanofiltration systems

Operating profile

The system uses reverse nanofiltration technology to remove micropollutants, to improve color and reduce total dissolved solids (TDS) level in water by a minimum of 95%, depending on raw water quality. System contains its own pressurization system to optimize the production of water through the membranes. System operating pressure should be between 60 and 90 psi (4,1 and 6,2 bar). System functionalities include monitoring and regulating devices to adjust the system's operating pressure. The system contains an electric inlet valve that closes when a tank full or a problem signal is received. A low pressure switch serves to protect pump from cavitation damage during low pressure occurrences. On/Off cycling is based on a normally open dry contact (ex.: level float switch), a pressure switch or an external contact. The unit is equipped with audible and visual alarms as well as a fused disconnect switch.

Pump design

Units use a multi-stage vertical stainless steel submersible pump. Pump motor is 3/4 HP (60Hz) or 1 HP (50Hz) and NEMA rated.

Membranes and housings

System uses 2 TFC nanofiltration membranes in a spiral wound configuration. Each membrane size shall be 102 x 1 016mm (4.0" x 40") with an area of 7,6 m². Each membrane and housing shall be rated for a working pressure to 225 psi (15,5 bar). Housings shall be mounted in a vertical configuration.

Plumbing configuration

System incorporates a reject recovery design and provides for an adjustable internally recirculated flow rate. Reject flow is controlled by a pressure regulating valve. During a shut down mode, the feed side of the membrane shall be flushed with at least 5 housing volumes of permeate water. PureRince cycle shall be automatic with each shutdown.

Skid

The system is assembled on a corrosion resistant stainless steel frame. The unit will not weight more than 163 kg during operation.
